**QUIETROCK™ SERENITY SOUNDPROOF DRYWALL  
NOW AVAILABLE IN 9 FT, 10 FT, AND 12 FT LENGTHS  
Provides multifamily builders with STC ratings of 51 – 68**

SUNNYVALE, Calif., April 12 -- Quiet Solution today announced new size additions to the QuietRock Serenity soundproof drywall product line. In addition to the popular 4x8 panel, QuietRock Serenity QR-530 is now available in 4x9, 4x10 and 4x12 foot sizes to meet the high volume and efficient installation requirements of large multi-family builders and contractors for party wall and ceiling construction.

QuietRock Serenity exceeds code and commercial requirements for both Sound Transmission Class (STC) and fire ratings. Made from gypsum and infused with proprietary viscoelastic polymers that convert noise and vibration to tiny amounts of silent heat, QuietRock Serenity provides unprecedented soundproofing for party walls and ceilings in new construction and rehab projects. QuietRock is 5/8" thick and uses the same framing as standard drywall. The assembly provides STC ratings of 51 – 68 and pulls 20-30 dB out of low frequencies – ideal for projects adjacent to railroad lines, airports and highways as well as party walls. The panels can be fastened to wood or metal studs using ordinary techniques by any drywall contractor. The new larger sizes meet the demand of cost-conscious multifamily builders.

**Litigation & Warranty Risk Reduced**

Noise is the second largest cause of litigation in multifamily construction. Outdated methods such as resilient channels are easily shorted out, destroying the lab rating and resulting in serious actionable complaints, lawsuits and warranty repairs. QuietRock drywall is the only technology today that cannot be short-circuited during or after construction, thus reducing contingent liability for builders, architects, engineers, and contractors involved in multifamily projects. With average repair claims exceeding \$10,000 per unit, the payback in risk-prone projects is immediate.

**Reduces Total Cost**

Double stud construction has often been used for achieving high STC ratings but imposes a dead-space penalty. QuietRock achieves the same or higher STCs with simple single-stud construction, thus recapturing valuable sellable floor space. By using single stud construction with QuietRock instead of double-stud, builders can achieve the required STC 50+ for market-rate projects, reduce labor, structural load, materials and construction time and recover up to 3-5% sellable space per unit. The extra 30-50 square feet of sellable space (at \$125-\$300 per square foot) results in an immediate return on investment that far exceeds the cost of the materials.

Quiet Brand products are available from hundreds of building material dealers nationwide. See [www.quietsolution.com](http://www.quietsolution.com) for more information or call the company directly at 800-797-8159.

**About Quiet Solution**

Quiet Solution designs and manufactures world-class soundproofing products for construction, transportation, and industrial markets. Its patent-pending, lab-tested technology is based on advanced proprietary viscoelastic polymers that absorb noise and vibration in the most demanding industrial and consumer applications. All of the company's products are environmentally friendly and manufactured in the USA. The company is headquartered in Silicon Valley, California.
