QUIET SOLUTION RELEASES NEW SOUNDPROOF DRYWALL Part of Soundproofing System, new drywall "Serenity" is only 5/8" thick.

Sunnyvale, CA – October 6, 2003 -- Quiet Solution today announced the availability of "Serenity" soundproof drywall (gypsum board) panel, its latest entry in its best-selling Soundproofing Systems. Rated by independent labs at STC 52-72 using standard construction, Quiet Solution product family is a breakthrough solution for residential and commercial construction. Built using a new multi-layer laminating process with viscoelastic polymers, it is ideal for home theaters, recording studios, conference rooms, multi-family dwellings and other construction wherever quiet is a requirement.

"Serenity" Drywall Panels

The latest entry in Quiet Solution Soundproofing System is an ultra-light, thin (5/8") reduced-cost soundproof drywall panel. The independent-lab-tested results shows that the Serenity panel achieves superb STC ratings with standard single stud construction, and performs exceptionally well at blocking low frequencies (e.g. 22 db Transmission Loss at 65 hertz). The new high-tech drywall can be used for both existing and new construction, and outperforms standard drywall by 20dB and older technologies such as soundboard/barrier by 10-15dB or more, essentially reducing noise and sounds from adjacent rooms by an additional 90%. "We can spec and use it just like drywall", stated Steve Haas, Principal of SH! Acoustics "No special construction techniques, no resilient channels, no exotic framing. It's exactly what the construction industry – and the demanding home theater community that we serve - has needed for 20 years."

Part of a Soundproofing System

The patented Quiet Solution Soundproofing System is composed of five elements: QuietRock (drywall panels for walls and ceilings); QuietWood (plywood panels for floors, walls, roofs and doors); QuietGlue (a viscoelastic polymer that efficiently absorbs noise by converting kinetic energy into tiny amounts of thermal energy); QuietCoat (a viscoelastic polymer that damps steel studs, HVAC ducts and metal roofs); and QuietSeal (a high-efficiency acoustical sealant). Each can be used individually or together as a system to easily achieve the highest STC's.

The Soundproofing System is available in three grades: the "Relief" series, with STCs in the 40s; the "Serenity" series, with STCs in the 50s; and the "Solitude" series, with STCs in the 60s and higher.

The new Serenity drywall, and the entire soundproofing system may be ordered from local sales offices (see www.quietsolution.com for more information) or by calling the company directly at 800-797-8159.

About Quiet Solution

Quiet Solution designs and manufactures world-class soundproofing products for three sectors: Construction & Building, Transportation & Vehicles, and Machinery & Appliances. Its patent-pending, lab-tested technology is based on advanced advanced viscoelastic polymers that absorb noise and vibration in the most demanding industrial and consumer applications. All the company's products are environmentally friendly and manufactured in the USA. The company is headquartered in Silicon Valley.
